

✚ Compute productions from downtime

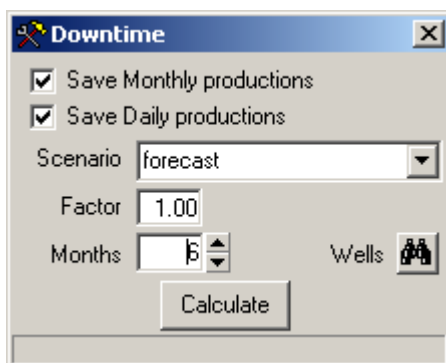

This tool, which can be opened from Tools > Compute productions from downtime..., allows calculating daily and monthly productions from tests and downtime, starting from the current date to a determined number of months set by the user.

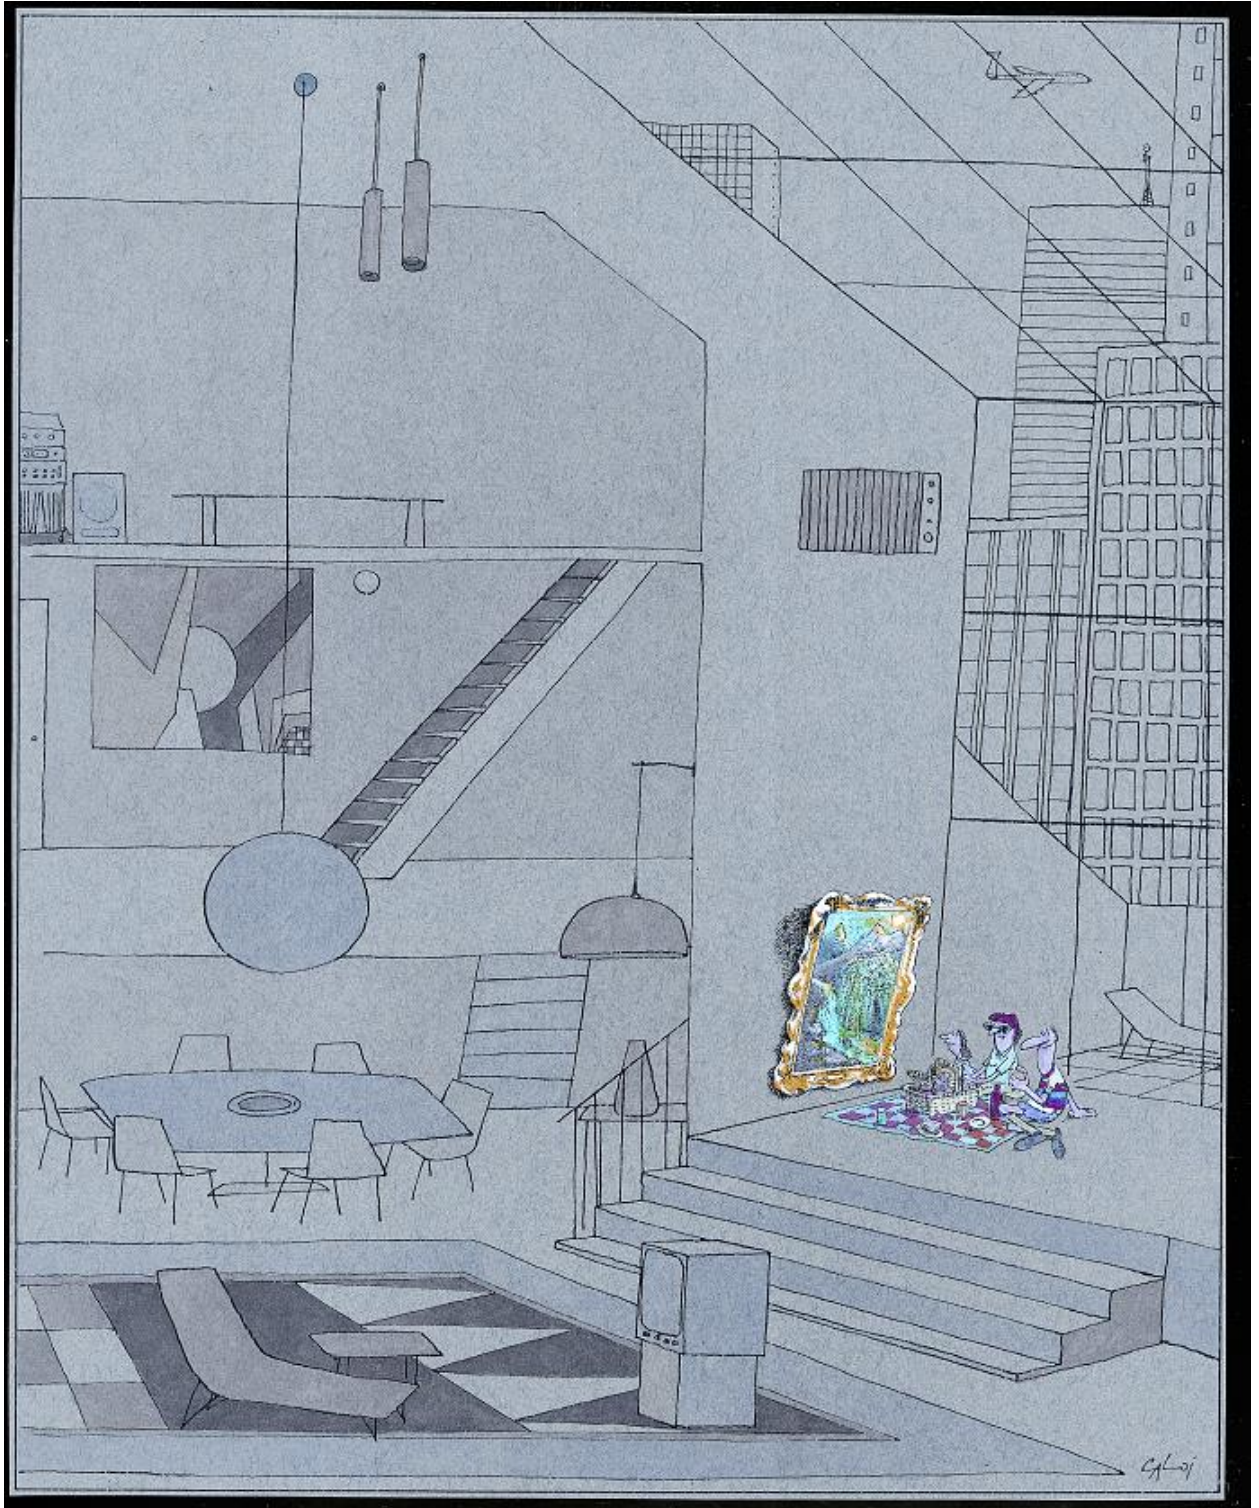

✚ Opciones

Monthly or daily productions may be saved, remembering that a scenario must be chosen for the former; again, for monthly productions, a forecast is done for the last month, weighing the computed rate until the current date.

The tool also allows choosing the number of months and the Wells for which this calculation is to be done.
